

# Torrentator – Usage Guide (11/14/2011)

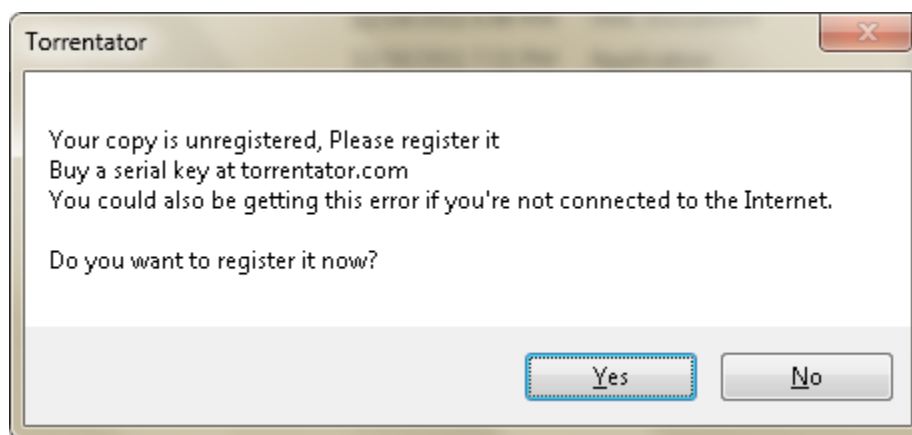

---

Congratulations on your purchase of Torrentator, this document has been created to help you get started and use the application correctly. It's all pretty simple, so hopefully there won't be too many pages.

## Getting Started:

To get started unzip the Torrentator.zip file you received and extract all the files to a folder on your PC. Go ahead and open the 'Application' folder and click double click on the 'MTU.exe' (it might also be called Torrentator.exe).

Open it up and once you do you will be presented with the registration screen below:

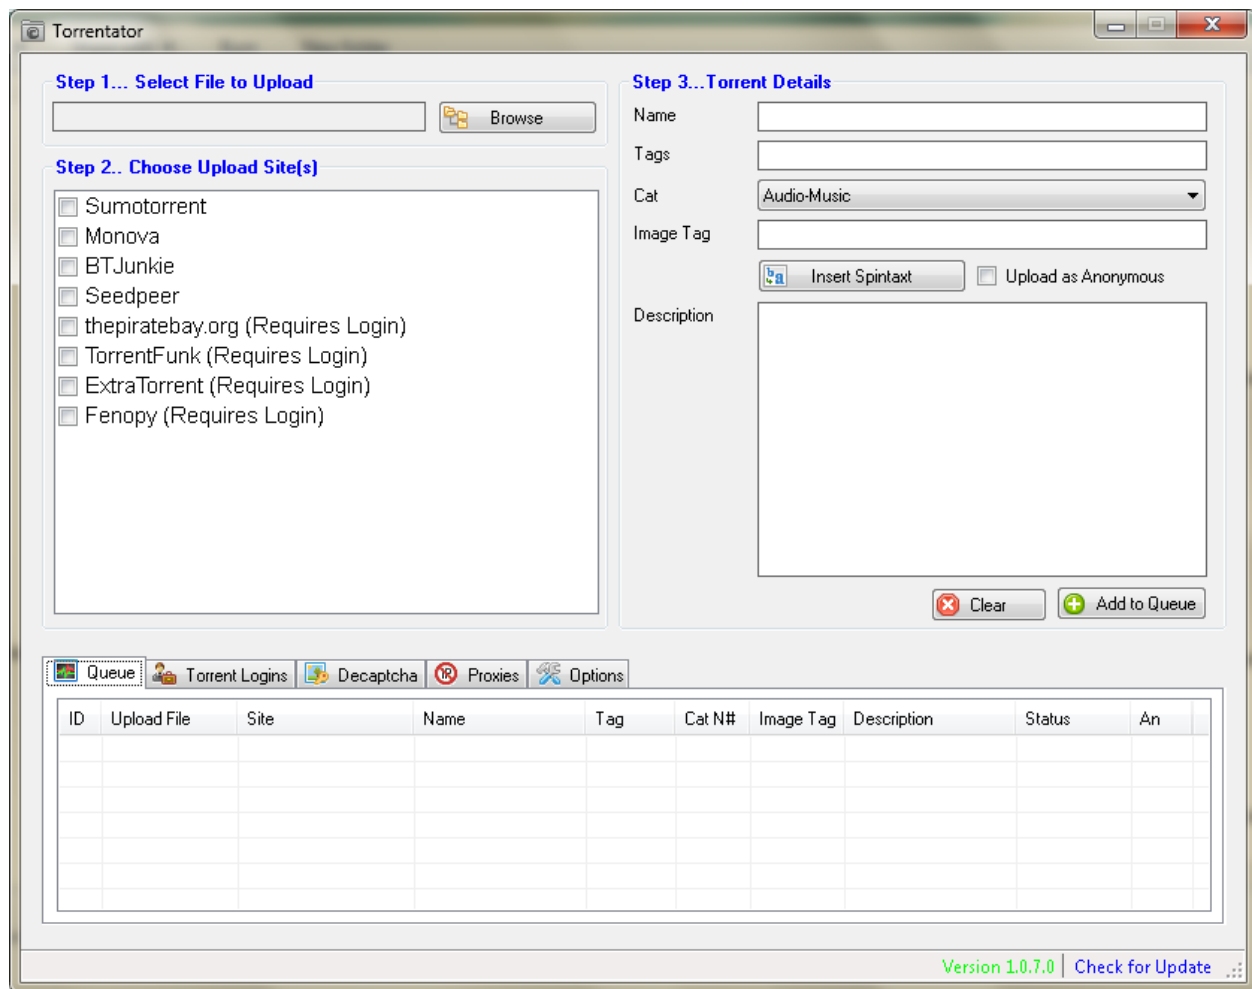

Press 'Yes' and you will be presented with a screen asking you for your serial key.

**Note:** When registering the application, all proxies/VPNs running on your computer must be disconnected. Also, you should have no dial up settings enabled in Internet Explorer.

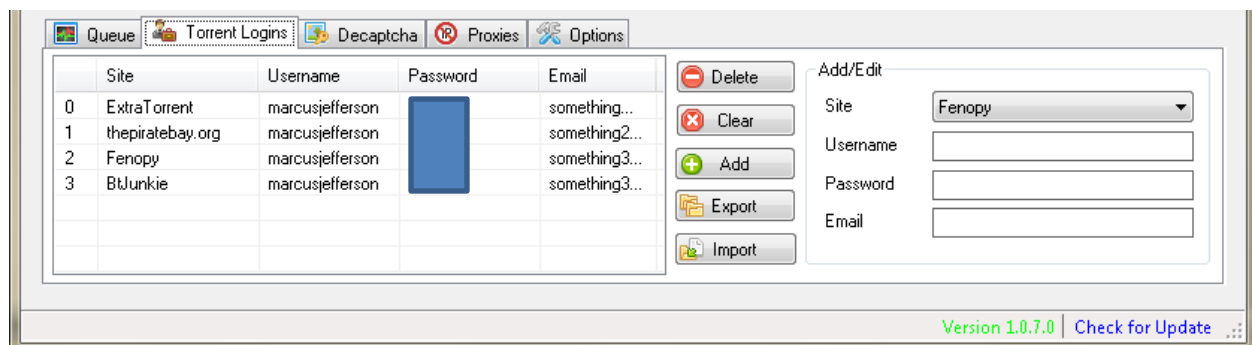

Enter the serial key you received in your welcome email and press OK.

After the application has registered you will receive a message notifying you that it was successful, and Torrentator will start. You will see this window:

## Torrent Logins:

The next thing you will need to do before uploading your first torrent file is to set up your torrent logins / accounts. Currently, there is no account creation from within the program but that is a feature that will be added shortly. In the meantime, click on the tab called, 'Torrent Logins' from the bottom.

In the example above, I have already added a few dummy accounts. It's pretty easy and can be done in two ways.

Either: from the add/edit menu on the right, select your torrent website, fill in the username/password (mainly) and/or the email as well and hit the 'add' button.

**If you're dealing with many accounts** it might be a good idea to import them. To do this, press the 'Import' button above and select the .txt file where your accounts are located.

The correct format for storing accounts in one .txt file is the following:

Website name:Torrent Username:Torrent Password:Torrent Email

Website name:Torrent Username:Torrent Password:Torrent Email

Website name:Torrent Username:Torrent Password:Torrent Email

**Here is a real example:**

ExtraTorrent:marcusjefferson:asdadasd:something@hotmail.com

thepiratebay.org:marcusjefferson:asdadasd:something2@yahoo.com

Fenopy:marcusjefferson:asdadasd:something3@msn.com

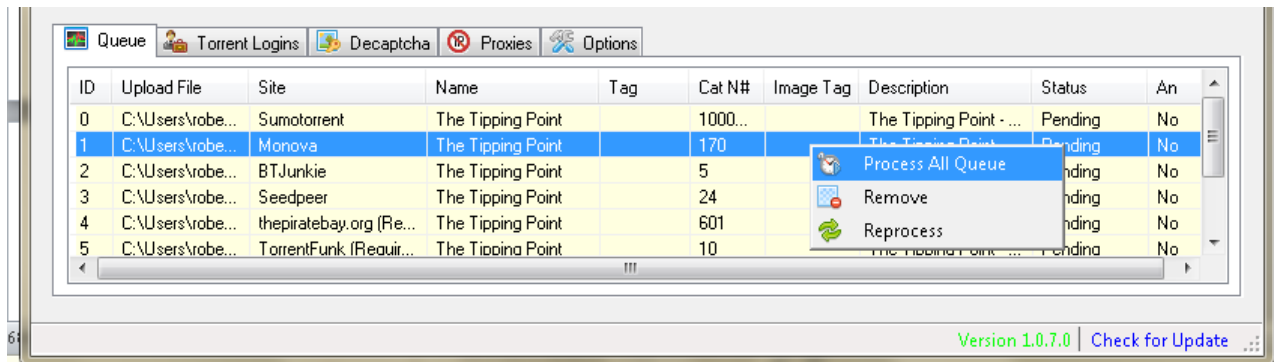

BtJunkie:marcusjefferson:asdadasd:something3@msn.com

(and so forth, separated line by line).

## Uploading:

Uploading torrents using *Torrentator* is simpler than it sounds, which is pretty simple anyway... ;)

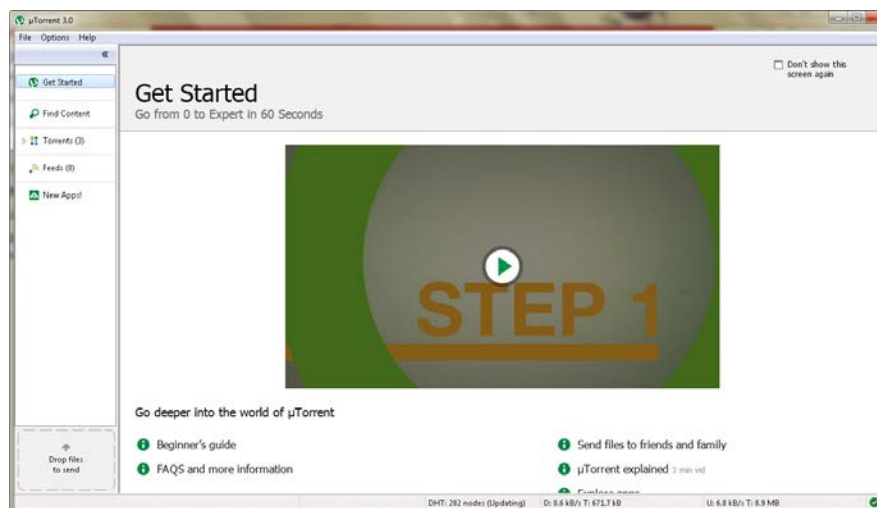

- Press the 'browse' button on the main screen of the program and select your created torrent file (more about creating torrents later).
- Check the boxes of the torrent websites/trackers you would like to get your torrent uploaded to.
- Enter in the torrent details on the right, including things like, name, category and description.
- Once you are happy with the torrent information, press the 'add to queue' button.
- This should make your torrents appear in the queue underneath, right click inside the queue box and select the 'process all queue' option to start the upload.

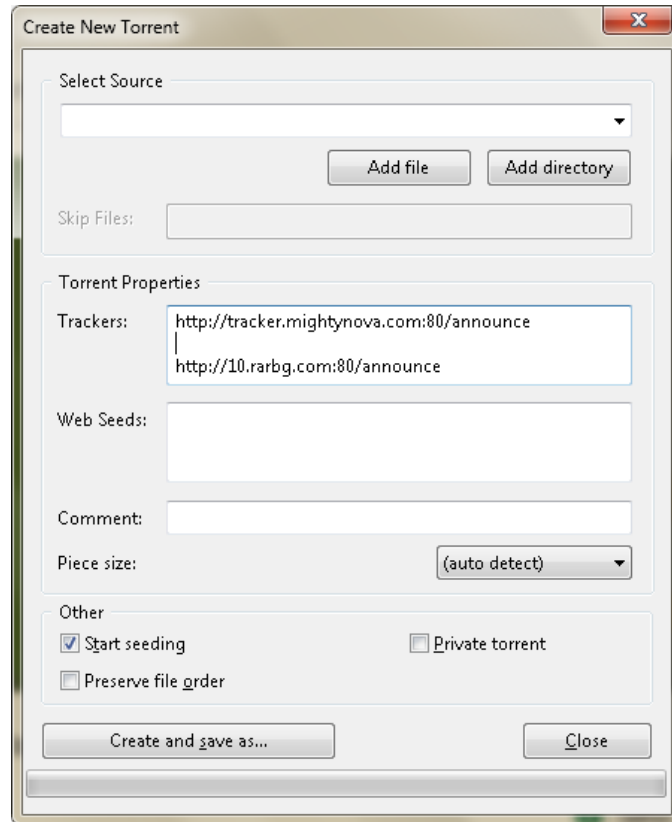

## Creating Torrents:

I presume you have access to an internet connection, browser and download/upload capabilities, if not you should look into obtaining these as soon as possible. Until *Torrentator* has torrent creation features built in, you will need to do this via an external service.

1. The first that you will need to do is download a BitTorrent client, I prefer using the latest version of [uTorrent](#) and that is what this tutorial will be based around, if you want however you could use another one and figure it out on your own. You can download it by clicking the link above.
2. After you have the application downloaded you will be presented with a screen that looks like this:

3. Click on File > Create New Torrent (CTRL + N) and the new torrent window should pop up.

4. Press 'add directory' and select the directory that contains the file you want to add as a torrent inside it. Make sure the file is correctly named and has the URL of your website on it. You should also include a shortcut in the same folder which leads directly to your website. Example below:

5. Under where it says, 'trackers' place the following URLs:  
<http://open.tracker.thepiratebay.org/announce>  
<http://www.torrent-downloads.to:2710/announce>

<http://denis.stalker.h3q.com:6969/announce>  
<http://www.sumotracker.com/announce>

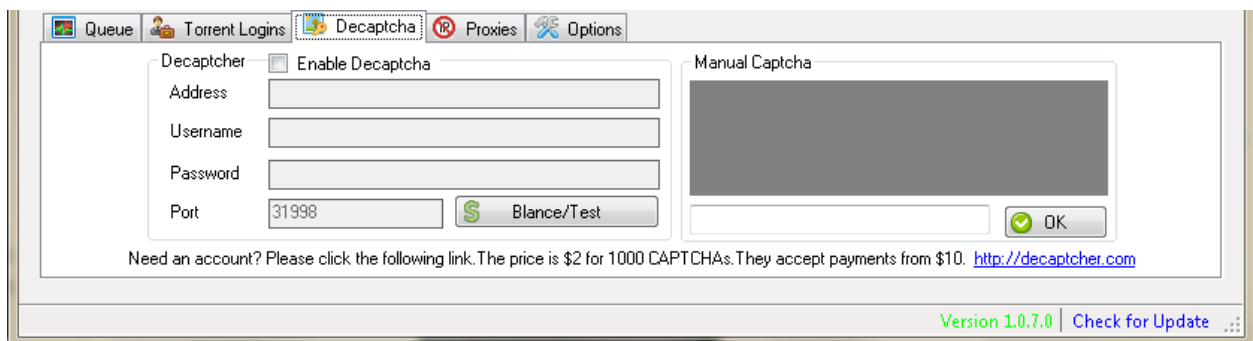

(You should also include the larger list included in the separate .txt file). These are the trackers that will be used to distribute your file.

6. Check the box that says, 'start seeding'. Set piece size to 'auto-detect' and make sure the torrent **isn't** private.
7. Press 'create and save as'.
8. Spread this torrent out using Torrentator!

## Decaptcher:

Decaptcher is a third party captchas solving service. It speeds up the submission of torrents as it doesn't require you to manually enter in the captchas. Essentially, set and forget!

First you will need to sign up at <http://decaptcher.com>, next press the 'decaptcha' button tab below to go to the Decaptcher information entry.

The screenshot shows a software window with several tabs: Queue, Torrent Logins, Decaptcha (selected), Proxies, and Options. The Decaptcha tab contains the following fields and controls:

- Decaptcher** section:
  - ☐ Enable Decaptcha
  - Address:
  - Username:
  - Password:
  - Port:
- Manual Captcha** section:
  - A large grey rectangular area for manual captcha input.
  - (with a green checkmark icon)

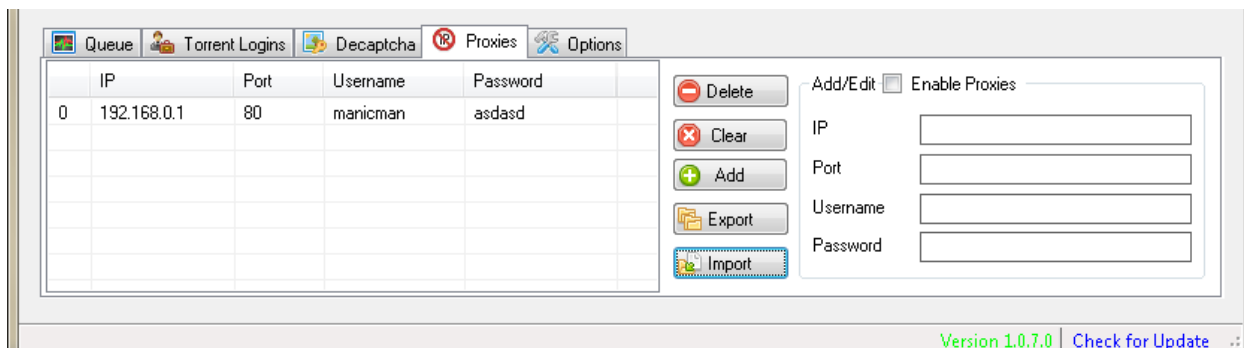

Below the fields, a message reads: "Need an account? Please click the following link. The price is \$2 for 1000 CAPTCHAs. They accept payments from \$10. <http://decaptcher.com>"

At the bottom right, it says "Version 1.0.7.0 | [Check for Update](#)"

Fill in the appropriate information above. You can find this after you log into decaptcher.com. The details should be on the homepage. Check the box that says 'Enable Decaptcha' otherwise you can enter captchas manually in the box to the right.

## Proxies:

Sometimes uploading too many torrents at once to a single Torrent website may get your IP temporarily suspended from any more uploads. This is unlikely, and I can't really see the need for using too many proxies with this application, but the option is available if needed.

You can either manually add proxies to your project by using the fields on the right and pressing the 'Add' button or you can import them from a .txt file.

The correct format for proxies located inside a .txt file is:

IP:Port

IP:Port

IP:Port

IP:Port

And if they are private / have login information then:

IP:Port:Username:Password

IP:Port:Username:Password

IP:Port:Username:Password

IP:Port:Username:Password

(and so forth, line by line)

### A real example:

192.168.0.1:80:manicman:cheesecakes1

**Note:** A VPN is usually smoother for something like this. We recommend using the Hide My Ass VPN as it comes with rotating IP support – <http://hidemyass.com/vpn/>, is the cheapest solution and has over 22,000 IPs built in.

## Spintax

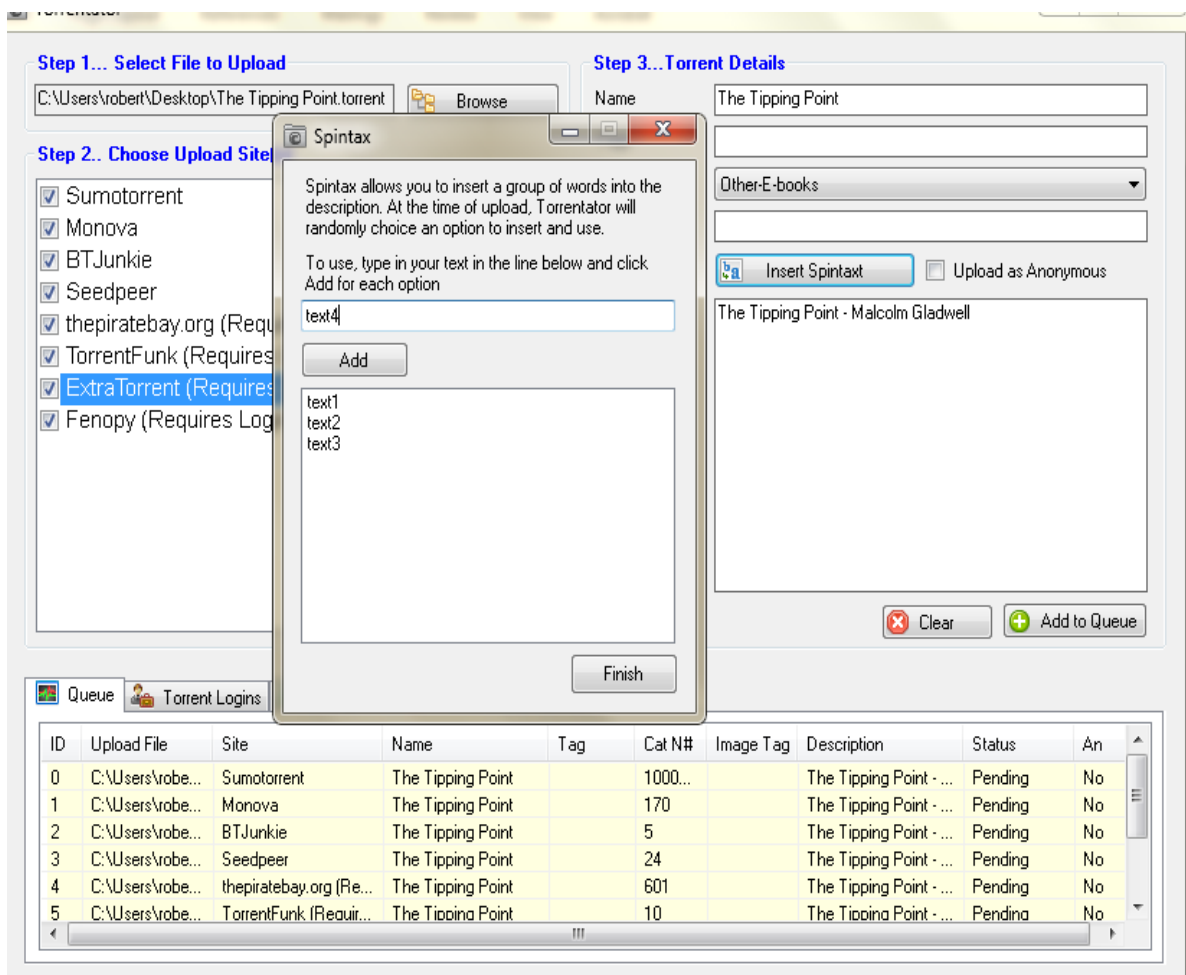

Spintax is a way of making *Torrentator* automatically rotate through different text / links during posting. It's helpful if you want to try out different titles/descriptions for your torrents and don't want to manually upload them each time.

The format for doing this is:

{text1|text2|text3}

(replacing 'text' with your text/link).

However, you can also achieve the same thing by using the 'insert spintax' button located on the torrent details section.

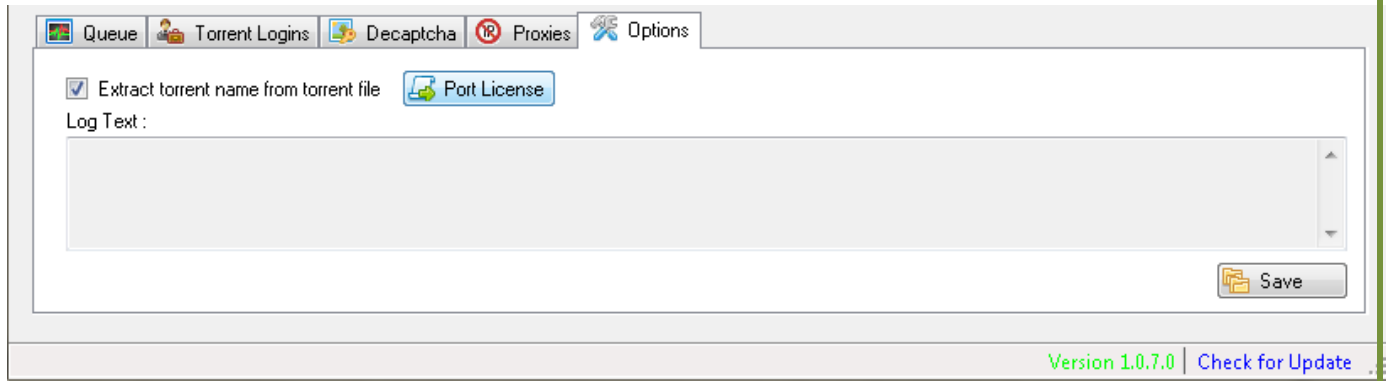

After adding the words and pressing finish, they will automatically be added in the correct format to your description.

## Uninstalling / Porting Licenses

*Torrentator* lets you de-register your license from one computer, so that you can use it on another without delay.

To do this you must press the 'Port License' button in the options tab, this will bring up a message asking if you want to de-register it. Click yes, and your key will be available to use elsewhere.

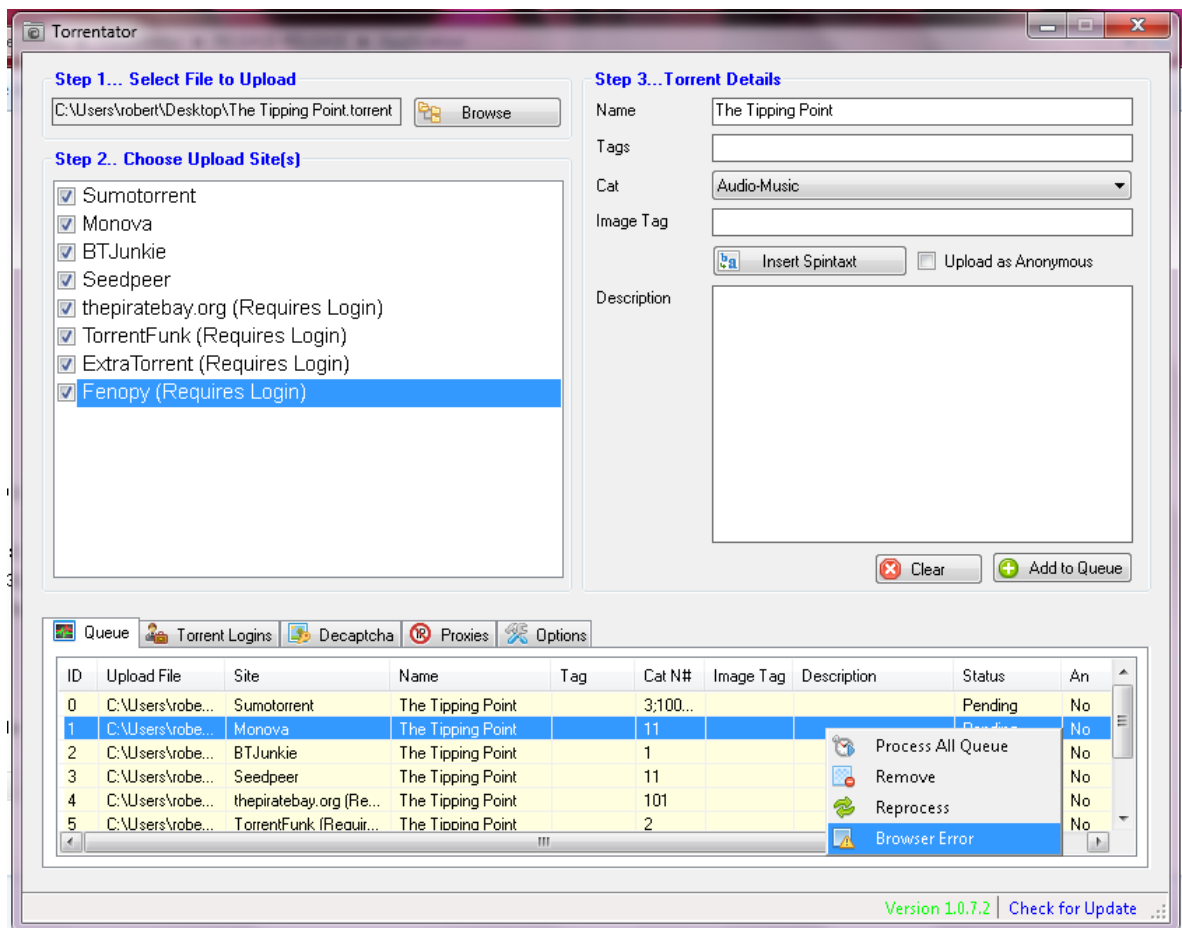

It is important that you do this **BEFORE** uninstalling your application as well, because otherwise the key will become invalid since the uninstallation won't delete the fact that it is still registered on our server. This means, that when you try to register again with it, it will say it is invalid.

## Browser Error / Go to URL

Torrentator now comes with a nifty way of looking at both torrents that error'd and the ones that were successful, directly from the queue tab. All you need to do is right click on the item that has an error in the queue, and select the 'browser error' option. This will navigate directly to the page and display the error that caused your upload to fail (usually, something like duplicate torrent, incorrect captcha, invalid filename etc).

Likewise, if you want to go to the URL of a successfully uploaded torrent, you can do this with most sites by following the same process. Right click on successful upload > Error browser / Go to URL.

And that's it for now. If you are still unsure about anything please make sure to look at our video tutorials at <http://youtube.com/torrentator> or contact support.

Good luck!

Rick
