How to Get Installs Using *Torrents*
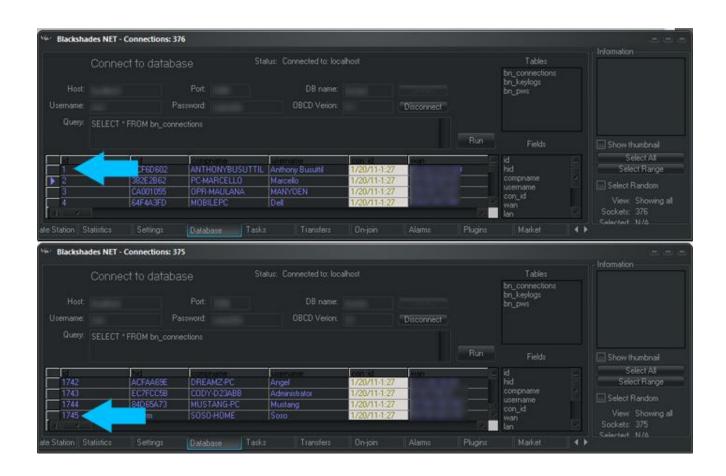

And

The *QuikN'EZ* Torrent Spreader

Written By: 00v6

Preface

Thank you for purchasing the QuikN'EZ torrent spreader! I guarantee that if you spend the time to do this properly you **will** get a very large number of installs quickly. In a period of a little bit over two weeks I managed to acquire over **1700 unique installs** just by spending a little bit of time preparing quality torrents and uploading them using this application.

Getting Started

We'll be spreading our server (or keylogger, etc.) by binding it to the .exe of popular applications, and then distributing it using the QuikN'EZ torrent spreader for maximum downloads. There are some important things you will need besides the spreader, however, to be successful in getting installs. You don't need anything too unique though, just the staples of many RATers.

Tools you will need besides QuikN'EZ:

- FUD crypter (this is critical for sustainable installs, don't cheap out)
- Binder
- Torrent client (I recommend uTorrent for Windows, KTorrent for Linux)
- File pumper (optional)
- VPS seed box/bots to seed on (optional, but helpful)

Preparing Your Torrents

First off you need to get some good applications. I recommend going to http://www.warez-bb.org/ and looking under the application section. Find threads with lots of posts that have been posted up a while ago. This way, your chances of the file not being infected by someone else are really good and you also find apps which people like and are more likely to download once you start spreading. Your application should be at least 20 – 50 megabytes so that people can't upload it to virus scanning websites and it also looks legitimate. If you have popular applications which are smaller, I recommend using a file pumper to get them to at least 20 megabytes to help prevent your server from being detected. Once you download 10 applications or so, extract the RARs, bind your server to each installation exe, and put them in a folder where you will be hosting your torrents. Save the threads you downloaded the application from! They usually have good descriptions you can steal for your torrent when your start spreading.

It is extremely important that your crypted/binded executable looks as real as possible (realistic creation date, realistic icon, realistic assembly info, etc.) and is **NOT** detected. If anything looks suspicious most users will not continue seeding the torrent and may even rate it negatively on the tracker they downloaded it from.

I have also had great success with large torrents such as anti-virus applications in the 200 megabyte region. If you have a seedbox (e.g. VPS server running Ubuntu and using KTorrent) or bots which can seed for you this is also a good investment of bandwidth for quality installs.

Seeding Your Torrents

Now that you have your server binded and crypted to realistic applications, you need to create your torrents. If you don't know how to do this then Google: "How to create torrents with *[your torrent client]*"

Here is a short list of public trackers I use when creating my torrent, it is formatted for uTorrent but should work with most clients. Make sure you have an http:// tracker (not udp://) in the first line as some websites only look at the first line and aren't compatible with udp:// trackers.

> http://tracker.publicbt.com/announce
> udp://tracker.publicbt.com:80/announce
> udp://tracker.openbittorrent.com:80/announce
> udp://denis.stalker.h3q.com/announce
> http://denis.stalker.h3q.com:6969/announce
> udp://tracker.openbittorrent.com/announce
> http://tracker.openbittorrent.com/announce
> udp://tracker.publicbt.com/announce
> http://tracker.publicbt.com/announce
> udp://tk.btcomic.net/announce
> http://tk.btcomic.net/announce
> udp://11.rarbg.com/announce
> http://11.rarbg.com/announce
> udp://nemesis.1337x.org/announce
> http://nemesis.1337x.org/announce
> udp://tracker.csze.com/announce
> http://tracker.csze.com/announce
> http://kbox.ath.cx/announce.php
> http://tracker.publicbt.com:80/announce
> http://genesis.1337x.org:1337/announce
> http://exodus.1337x.org/announce
> http://tracker.openbittorrent.com/announce
> udp://tracker.openbittorrent.com:80/announce
> http://denis.stalker.h3q.com:6969/announce

Make sure all of your torrents are seeding (sometimes application preferences limit the number of torrents active at a time). I recommend just maximizing all the settings out initially.

[OPTIONAL] Once you have created your torrent and are seeding it in your favorite torrent client, you can use your bots to download the torrent and help seed it for you. Alternatively you could use a VPS with a high-speed link to the internet backbone to seed as well.

A good VPS host is HostRail, I recommend their high-speed offshore NL VPS servers running Ubuntu 10.10 with 1.25 GB of RAM for ~$10/month. They come with KTorrent. Request a VNC and ask them to remove your uplink speed cap – they'll do it.

Spreading Your Torrents

Open up the QuikN'EZ Torrent Spreader. We need to fill in the descriptions and data for each of our torrents. Use information from the threads you downloaded your applications from or simply Google the application name for the description. Use Google images for the pictures if the WarezBB threads don't have any you can rip. I recommend mirroring images on www.imageshack.us then using the direct provided.

When naming your torrent ***don't*** include phrases such as "CRACK" or "Keygen!!" People know that the torrent is free (otherwise why would it be there) and this simply makes it look less reliable. Keywords such as "No license" are more effective.

Once you have your configuration set, SAVE the data in case you need to come back to it. Just give it any name and hit save. The application automatically generates the save files. Don't forget the configuration name though!

Go through each tab and copy over the data then upload your torrent. Each torrent tracker has its nuances but you'll get used to the process fairly quickly. Some of the websites need accounts, just make a dummy email and fake account. Some sites are stricter than others when it comes to banning but usually you'll only need one account for the life of your torrent uploading.

Make sure to seed your torrents 24/7 until you have at least 30 or so other seeders. This is also critical because otherwise your torrent will die out very quickly.

Good luck and happy spreading!
